Assignment 01
Write a Java program to convert a given decimal number (including fractional number) to binary number. ex: inputs 12.5, 12.0, 34.1

Write a Java program to convert a given binary number (including fractional number) to decimal point number. ex: inputs 1101.101

Assignment 02
Write a Java program to convert a given decimal floating number to double precision and vice versa.

Assignment 03
1.Write a class for full matrix
2.Write a class for row vector
3.Write a class for column vector
4.Combine all the classes in a single class
5.Convert a full matrix into row vector and column vector classes and vice versa

Assignment 04
Design a class for symmetric matrix using column vector.

Assignment 05
Write a Java program to represent Sparse symmetric matrix and use it. Note that you need to minimize the memory use.
